

#### IN THE CLAIMS

CIRCUITS WITH A TRENCH CAPACITOR HAVING MICRO-ROUGHENED SEMICONDUCTOR SURFACES

1-16. (Canceled)

17. (Currently Amended) A memory cell, comprising:

a transistor formed in a layer of semiconductor material outwardly from a substrate, the transistor including a first source/drain region, a body region and a second source/drain region, that are vertically aligned;

a trench capacitor formed in a trench and coupled to the first source/drain region; and a second plate of polycrystalline material formed in the trench that is coupled to a first plate integral with the second source/drain region thereby forming a conductorless electrical connection between the trench capacitor and the transistor, the first plate having an etchroughened surface; and

an insulator layer that separates the second polycrystalline plate from the etch-roughened surface of the first plate, wherein the transistor further including a gate adjacent to the body region and the gate being vertically aligned with the second plate.

- 18. (Previously Presented) The memory cell of claim 17, wherein the second polycrystalline semiconductor plate comprises polysilicon.
- 19. (Previously Presented) The memory cell of claim 17, wherein the first plate comprises a heavily doped p-type silicon substrate.

20-21. (Canceled)

22. (Currently Amended) A memory cell, comprising:

a vertical transistor formed outwardly from a substrate, the transistor including a first source/drain region, a body region and a second source/drain region that are vertically aligned;

wherein a surface of the second source/drain region includes integral therewith a first plate having a polycrystalline surface layer that is etch-roughened;

itle: CIRCUITS WITH A TRENCH CAPACITOR HAVING MICRO-ROUGHENED SEMICONDUCTOR SURFACES

a trench capacitor having a second plate that is formed in a trench that surrounds the first plate; and

wherein the first plate forms a conductorless electrical connection between the trench capacitor and the transistor, wherein the vertical transistor further including a gate adjacent to the body region and the gate being vertically aligned with the second plate.

- 23. (Previously Presented) The memory cell of claim 22, wherein the first plate integral with the second source/drain region comprises single crystalline silicon upon which is formed the layer of polysilicon.
- 24. (Canceled)
- 25. (Previously Presented) The memory cell of claim 22, wherein the second plate comprises polysilicon.
- 26. (Currently Amended) A memory device, comprising:

an array of memory cells, each memory cell including a vertical access transistor that is coupled to a trench capacitor wherein a first plate of the trench capacitor is integral with a second source/drain region so as to form a conductorless electrical connection between the trench capacitor and the vertical access transistor, the first plate including a micro-roughened surface layer of porous polysilicon, and a second plate of the trench capacitor disposed adjacent to the first plate, wherein the vertical access transistor including a body region vertically aligned with the second source/drain region, and a gate adjacent to the body region, the gate being vertically aligned with the second plate;

- a number of bit lines that are each selectively coupled to a number of the memory cells at a first source/drain region of the vertical access transistor;
- a number of word lines disposed substantially orthogonal to the bit lines and coupled to gates of a number of vertical access transistors; and
- a row decoder coupled to the word lines and a column decoder coupled to the bit lines so as to selectively access the cells of the array.

CIRCUITS WITH A TRENCH CAPACITOR HAVING MICRO-ROUGHENED SEMICONDUCTOR SURFACES

- 27. (Previously Presented) The memory device of claim 26, wherein the first plate comprises a single crystalline layer upon which is formed the layer of polysilicon .
- 28. (Canceled)
- 29. (Previously Presented) The memory device of claim 26, wherein the second plate comprises polysilicon.
- 30. (Canceled)
- 31. (Currently Amended) A memory cell, comprising:

a transistor formed in a layer of semiconductor material outwardly from a substrate, the transistor including a second source/drain region having a first plate formed integral therewith, a body region and a first source/drain region vertically aligned with the second source/drain region; and

a trench capacitor formed in a trench and electrically coupled without an intervening conductor to the first plate; and

wherein the trench capacitor includes a polysilicon second plate formed in the trench that is coupled to the first plate of the second source/drain region, the first plate including a surface layer of polysilicon that is etch-roughened, and an insulator layer that separates the polysilicon second polysilicon plate from the etch-roughened polysilicon surface of the first plate, wherein the transistor further including a gate adjacent to the body region and the gate being vertically aligned with the polysilicon second plate.

- 32. (Previously Presented) The memory cell of claim 31, wherein the first plate comprises heavily doped p-type silicon.
- 33. (Currently Amended) A memory cell, comprising:

a transistor formed in a layer of semiconductor material outwardly from a substrate, the transistor including a second source/drain region having a first plate formed integral therewith, a body region and a first source/drain region vertically aligned with the second source/drain region; and

a trench capacitor formed in a trench and electrically coupled without an intervening conductor to the first plate;

wherein the trench capacitor includes a second plate of polysilicon formed in the trench so as to surround the first plate, and an insulator layer that separates the second polysilicon plate from at least the etch-roughened surface of the first plate, wherein the transistor further including a gate adjacent to the body region and the gate being vertically aligned with the second plate.

### 34. (Currently Amended) A memory cell, comprising:

a vertical transistor formed outwardly from a substrate, the transistor including a first source/drain region, a body region and a second source/drain region that are vertically aligned, wherein the second source/drain region includes integral therewith a single crystalline silicon first plate with a layer of polysilicon having an etch-roughened surface; and

a trench capacitor with a second plate that is formed in a trench and that surrounds at least the etch-roughened surface of the first plate; and

wherein the first plate forms a conductorless electrical connection between the trench capacitor and the transistor, wherein the vertical transistor further including a gate adjacent to the body region and the gate being vertically aligned with the second plate.

## 35. (Currently Amended) A memory device, comprising:

an array of memory cells, each memory cell including a vertical access transistor that is electrically connected without an intervening conductor to a trench capacitor by a first plate of the trench capacitor that is integral with a second source/drain region of the vertical access transistor, the first plate including a micro-roughened surface of porous polysilicon, with a second plate of the trench capacitor disposed so as to surround at least the micro-roughened surface of the first plate, wherein the vertical access transistor including a body region vertically

aligned with the second source/drain region, and a gate adjacent to the body region, the gate being vertically aligned with the second plate;

a number of bit lines that are each selectively coupled to a number of the memory cells at a first source/drain region of the vertical access transistor;

a number of word lines disposed substantially orthogonal to the bit lines and coupled to gates of a number of vertical access transistors; and

a row decoder coupled to the word lines and a column decoder coupled to the bit lines so as to selectively access the cells of the array.

- 36. (Previously Presented) The memory device of claim 35, wherein the vertical access transistor includes a body region of p-type single crystalline silicon adjoining the second source/drain region, wherein the second source/drain region is n-type single crystalline silicon.
- 37. (Previously Presented) The memory cell of claim 31, wherein the second source/drain region is P-doped or N-doped.
- 38. (Previously Presented) The memory cell according to claim 33, wherein the second source/drain region is N-doped or P-doped.
- 39. (Previously Presented) The memory cell according to claim 34, wherein the single crystalline polysilicon is P-doped or N-doped.
- 40. (Previously Presented) The memory cell according to claim 35, wherein the second source/drain of the vertical access transistor is P-doped or N-doped.
- 41. (Currently Amended) A memory cell, comprising:

a transistor comprising outwardly from a substrate a second source/drain region at least a portion of which serves as a single crystalline first capacitor plate for forming a conductorless connection of the transistor to a trench capacitor, a body region and a first source/drain region

vertically aligned with the second source/drain region, wherein the first capacitor plate includes a micro-roughened surface for increasing the capacitance of the trench capacitor;

the trench capacitor being formed in a trench surrounding a portion of the transistor and including a second capacitor plate of polycrystalline material formed so as to surround the first capacitor; and

an insulator layer that separates the second polycrystalline semiconductor plate from the micro-roughened surface of the first plate, wherein the transistor further including a gate adjacent to the body region and the gate being vertically aligned with the second plate.

- 42. (Previously Presented) A memory cell according to claim 41, wherein the microroughened surface of the first capacitor plate comprises a layer of polysilicon.
- 43. (Previously Presented) The memory cell according to claim 41, wherein the second source/drain region that includes the first capacitor plate, the body region, and the first source/drain region are formed as a pillar of single-crystal semiconductor material.
- 44. (Previously Presented) The memory cell according to claim 41, wherein the second plate also surrounds first plates of adjacent memory cells.
- 45. (Previously Presented) The memory cell according to claim 44, wherein the second plate is grounded.
- 46. (Previously Presented) The memory cell according to claim 17, wherein the first plate also surrounds second plates of adjacent memory cells.
- 47. (Previously Presented) The memory device according to claim 26, wherein the second plate also surrounds first plates of adjacent memory cells.
- 48. (Previously Presented) The memory cell according to claim 31, wherein the second plate also surrounds first plates of adjacent memory cells.
